

The attached spreadsheet lists products that either are certified as being IPv6 certified by the Joint Interoperability Test Command (JITC) or are waiting for its certification testing. If the product is not listed, the original equipment manufacturer has not submitted it for testing.

The worksheets are equipment categories for router, Layer 3 switch, Network server, and information assurance device. Each product and its IPv6 standards are listed as you traverse the worksheet. In the cell beneath a product name, and if the product is included on the JITC approved products list, a Y (for yes) or a Pending is shown. Yes means that the product is included on the JITC approved products list and Pending means that it is awaiting approval.

Also, for each product, specific IPv6 standards are shown. If a Y (for yes) is shown, the product complies with the standard. If N (for no), it does not comply.
